

ABSTRACT OF THE DISCLOSURE

A birdhouse that has separate multi-unit, compartmentalized nesting chamber towers that can easily be removably mounted together. Having multiple units removably attached allows for easy cleaning and removal from the pole, and decreases the spread of disease. Also, having multiple ventilation areas within the nesting chambers of the

5 birdhouse allows for greater air movement within the towers. The ventilation will help decrease the suffocation of young birds during the hot and humid months.
